

Agenda for today's meeting

- Solution Objective and timeline
 - User Journey
 - End-to-End Process Overview
 - Data & System Dependency Map
 - Multi-Dimension Analysis
 - Demo Objective and Timeline
 - QA

Solution Implementation Timeline

From scope alignment to launch readiness and post-launch stabilization

Key dependencies

Business owner availability | Data access approval | Integration API readiness | UAT user participation | Launch governance sign-off

Agenda for today's meeting

User Journey

Solution Objective and timeline

End-to-End Process Overview

Data & System Dependency Map

Multi-Dimension Analysis

Demo Objective and Timeline

QA

Policy AI Lab – Role-Based User Journey Swimlane Diagram

From opportunity identification to policy implementation, scenario analysis, consultation feedback, AI review, high-risk threshold & guardrail review, and continuous learning learning loop workflow.

Agenda for today's meeting

Solution Objective and timeline

User Journey

➤ End-to-End Process Overview

Data & System Dependency Map

Multi-Dimension Analysis

Demo Objective and Timeline

QA

Use Cases covered: UC-01 to UC-17

Foundation Knowledge / Registry Analyze (AI) Human-in-the-Loop Decision / Approval Learning

Agenda for today's meeting

Solution Objective and timeline

User Journey

End-to-End Process Overview

➤ Data & System Dependency Map

Multi-Dimension Analysis

Demo Objective and Timeline

QA

Policy AI Lab – Data & System Dependency View

Focus scope: data foundation across all use cases

From core data sources → system foundation → use case enablement → benchmark validation

 Internal Data

 External Data

 Benchmark / Reference Data

 Use Case Enablement

 System Foundation

 **Data & system dependency logic**

- Internal and external data are the operational foundation for all use cases.
- The shared data layer supports drafting, analytics, simulation, risk, and approval modules.
- International benchmark data strengthens policy benchmarking and simulation validation.

 **Cross-cutting platform foundation**

Governed integrations, access control, audit trail, and data lineage support the full Policy AI Lab ecosystem

Demo Objective and Timeline

Policy AI Lab – Flow-Driven Dependency View

Focus scope: UC-01, UC-02, UC-03, UC-12

From policy drafting → dependency outputs → analysis → risk evaluation

 Knowledge / Output  Analyze (AI)  Risk / Decision  Flow / Dependency

Flow-driven dependency logic

- UC-01 creates the policy draft that drives downstream analysis.
- UC-02 and UC-03 both depend on the policy object and metadata from UC-01.
- UC-12 consolidates downstream outputs for risk evaluation.

Cross-cutting foundation

Role-based access, audit trail, and lifecycle governance support the whole flow

Policy AI Lab – Multi-Scenario Simulation Full-Flow View

Focus scope: simulation end-to-end + multi-route / multi-scenario support

From policy input → simulation setup → multi-route scenarios → comparison → risk review → approval → learning

Agenda for today's meeting

Solution Objective and timeline

User Journey

End-to-End Process Overview

Data & System Dependency Map

Multi-Dimension Analysis

➤ Demo Objective and Timeline

QA

Policy AI Lab Demo Timeline

Final target: 26th

“policy simulation” pipeline: Demonstrate the end-to-end policy simulation flow, from policy inputs and scenario combinations to ABM-based iterations, KPI projections, risk assessment, Monte Carlo stability checks, and backtesting evidence.

Milestones

Core ABM flow → Monte Carlo stability → result analysis → multi-scenario demo case → final demo package

Policy Simulation Clarification Questions

For customer alignment before finalizing HLSD and demo implementation assumptions

Objective: Confirm key design decisions for baseline scenarios, simulation variables, and data snapshot/versioning governance.

1. Baseline Scenario

- Is the Baseline Scenario generated automatically by the system, or manually created / selected by the Economist?
- Which data sources and business rules should be used to generate the default Baseline?
- Should the Baseline be locked for each simulation run or adjustable by authorized users?

2. Simulation Variables

- Do variable default values come from data sources, expert configuration, or built-in system defaults?
- Who is authorized to modify variables and assumptions?
- Does any modification trigger re-approval before simulation execution?

3. Data Snapshot & Versioning

- Must every simulation run save a data snapshot?
- Should the snapshot store a full data copy, or only source version, pull time, and parameter metadata?
- What retention, audit, and traceability requirements should apply?
